Abstract

The REMEDIES (RE-configuring MEDICines End-to-end Supply) project, launched in 2014, is headed up by GlaxoSmithKline (GSK) with research led by the University of Cambridge's Institute for Manufacturing. It brings together key players in the end-to-end supply chain, including major contract manufacturing organizations, equipment manufacturers along with regulators, knowledge transfer networks, and healthcare providers.

Mission

To provide a better service to patients and to safeguard jobs across the UK, the consortium has several technology-based application projects underpinned by two platform projects: clinical trials supply chains, led by GSK, and commercial supply chains led by IfM. The project involves several inter-related application work streams.

Consortium History
